## **Extruder**

Hot rubber is pressed through an extruder in car tire fabrication on a belt conveyor. There it gets stamped, cooled and finally cut.

In turn, the width of the rubber depends on the speed of the belt conveyor. So in order to control the extruder our system measures the width of the rubber and saves the results to the network, where they are used for controlling the process.

### **Features:**

- Smart-camera system
- Width measurement
- Product database
- Communication with PC for statistical analysis
